Investor roadshow companion

FE5209 academic paper fund. Prepared 17 October 2026. The new presentation uses investor language while keeping responsibility for quantitative decisions clear.

The coordinator becomes the Investment Committee / CIO

Role	Responsibility in this project
Investors	Provide illustrative paper capital and evaluate reporting.
Board of Directors	Human student team approves the mandate, policy and material changes.
Investment Committee / CIO	Reviews PM evidence and applies a declared capital-allocation policy.
Three PMs	Own the strategy, virtual account and diagnostics for momentum, daily pairs and crypto.
Independent risk controller	Enforces coded limits before an execution intention.

What the AI aspect actually means

A proposed PM representative chooses relevant read-only diagnostic tools, examines computed facts and writes an explanation. Separate contexts and mandates make the representatives distinct. A future committee chair compares their memos and asks follow-up questions. AI reporting is the output of this review process.

The current local prototype connects crypto and pairs, exposes diagnostic tools and accepts optional imported model replies. Automatic provider calls and autonomous tool selection remain pending. Quantitative code calculates targets. Risk code retains approval authority.

One-minute video plan

The supplied script contains 124 whitespace-delimited words. Use the four-slide pitch deck. Planned durations total 60 seconds. Rehearsal and the exported MP4 determine actual duration.

0-10 seconds: The opportunity

Investors face a familiar problem: one trading style can struggle when markets change, while separate reports hide the portfolio's combined risks.

10-25 seconds: Our solution

Our proposed five-million-dollar paper fund combines equity momentum, daily pairs trading and crypto. An Investment Committee sets PM mandates under a human Board. AI representatives would investigate diagnostics and explain the evidence.

25-45 seconds: The evidence

Our local prototype connects crypto and pairs with independent risk checks. The prototype records intentions, with zero fills. Historical crypto validation returned 10.09 percent after modelled turnover costs, versus 10.77 percent for equal-weight bitcoin and ether. Full-fund results remain pending.

45-60 seconds: The pitch

We invite you to assess a transparent paper pilot: inspect every proposal, challenge every explanation, and judge the final out-of-sample results. The goal is a fund you can understand and audit.

Recording and export

Record narration over the pitch slides in PowerPoint or another editor. Aim for a 58-60 second export. Use a hard transition at each planned boundary. Check numbers aloud because percentages take longer to speak than their word count suggests.

Add subtitles and align the draft SRT to the actual audio. Export MP4, verify its duration and play it once from start to finish. Upload it to a class-accessible location and test the share link. This pack contains no recorded MP4 or narration.

The course announcement allows narrated PowerPoint. Its video is optional and capped at 60 seconds. Tool availability or pricing has not been assumed.

Presenter notes and likely questions

What should we say about the return evidence?

The separate daily crypto baseline returned 10.089% in validation from 1 January 2024 to 31 July 2026, after its configured 10 bps turnover model. Equal-weight BTC/ETH returned 10.768%. Baseline maximum drawdown was -23.778% and zero-risk-free Sharpe was 0.321. It did not beat the reported benchmark. These figures do not establish combined-fund performance.

Why combine momentum, pairs and crypto?

They provide different proposed mandates, but their diversification benefit is a hypothesis. Crypto and equity momentum can share directional risk. Show measured correlations, contribution to drawdown and after-cost consolidated performance before claiming improvement.

Why use USD 5 million?

It is the team's illustrative paper-capital convention: USD 1.5m per PM and USD 0.5m central cash. It is subject to the course convention. Starting account capital is not earned return. Momentum capital stays in cash until its engine connects.

What is already implemented?

The local crypto/pairs integration generates proposals, diagnostic facts, risk decisions and grouped intentions. It records zero fills. Momentum, automatic AI calls, the dashboard, costed fund fills and consolidated P&L; remain work to complete.

How should the pairs PM run?

Daily frequency is confirmed. After-close signals and next-eligible-session fills are proposed conventions requiring agreement with the strategy owner. Preserve the signed hedge relationship, actual exchange sessions and data timestamps. Validate borrow availability and the handling of partial two-leg fills.

What will make the final roadshow convincing?

Use one genuine recorded decision to show the PM proposals, a diagnostic investigation and a coded risk verdict. Then show the final out-of-sample NAV against the official benchmark with costs, dates and PM attribution. Name each member's contribution.

Submission plan

Deadline: Saturday, 24 October 2026. Confirm the actual Canvas cutoff hour and timezone. The course evaluation window remains 1-23 October 2026.

Required: one Canvas ZIP

Include editable slides, supporting data and source code. Retain the earlier brief's daily closing-price CSV and named contribution statement. Add requirements, run instructions, data provenance, after-cost NAV and benchmark series, and all required KPIs.

Required: group registration spreadsheet

Enter the group name, every member's information and out-of-sample strategy or forecast performance. Include a class-accessible video link if a video is prepared. The URL is preserved in course_announcement_summary.txt.

Suggested work sequence

Date	Team action
17-18 Oct	Confirm roles, assets and benchmark. Review the interfaces and evidence gaps.
19-22 Oct	Complete only defensible integration scope. Preserve forward records and clearly label replays.
23 Oct	Close the evaluation window under the declared data cutoff. Freeze and reconcile final KPIs.
24 Oct	Finalize names and slides, record optional pitch, test the archive and submit before the actual cutoff.

Readiness gaps the team must close

Member names, momentum details, mandatory assets, official benchmark and final fund performance still need confirmation or completion. The optional narration and video link also remain to be produced. The supplied submission_checklist.txt contains the detailed checks.

The roadshow ZIP is a presentation handoff pack. It contains neither a complete strategy/data submission nor a finished video. No Canvas upload or spreadsheet edit has taken place.
